GUIDELINES FOR COMPLEMENTARY FEEDING IN PRETERM INFANTS
Nutritional needs of preterm infants

The nutritional needs of preterm infants requires special attention. After a certain period, breast milk alone is not sufficient to meet the baby’s requirements. Solid feeds i.e. complementary feeds must be gradually introduced into the infant’s diet. Timely introduction of solid feeds is essential for the baby’s growth and development. Do not delay the introduction of complementary feeds. The following guidelines are mainly for preterm infants born before 34 weeks of gestation.

General Instructions

- Include adequate food supplements to the preterm infant’s diet starting from 3-4 months of corrected age (as advised by doctor) in addition to continuing breastfeeding.

  Corrected age corrects for baby’s prematurity. It is calculated by subtracting the number of weeks early that the baby is born (term pregnancy = 40 weeks). Example, if the baby was born at 32 weeks (i.e. 8 weeks premature) and current age is 6 months, then the corrected age is 4 months.

- Introduce only one food at a time.

- A single-ingredient food to be chosen and introduced at weekly intervals.

- Persist with the feed started till the baby starts accepting. The baby may spit the food initially and then start accepting the feed. It may take a week or 10 days for the baby to get used to and start accepting one complementary feed.

- Give very small amounts of any new food at the beginning. Begin with small quantities, gradually increasing the quantity.

- Use a very thin consistency when starting solid foods and but gradually increase it to semi-solid (porridge) consistency and then move over to solids.
## First month of complementary feeding

</tbody>
</table>
Amylase Rich Flour (ARF) preparation

- Take 250g of wheat and add 2-3 volumes of water
- Soak for 8 hours and drain excess water
- Germinate wheat in dark for 24 to 48 hours
- Sun dry for 5 to 8 hours and roast in a pan to remove remaining water
- Grind, powder the grains, sieve the powder and store in an airtight jar
- Add 1-2 teaspoons of amylase rich flour (ARF) to the cooked porridge after it cools a little. The porridge should be boiled again for a few minutes after adding ARF.

Note: There cannot be one schedule for all babies. Customise frequency and amount as per needs of the individual baby.

Standard Measuring Spoons / Cup
(Source: Dietary Guidelines for Indians, 2011, NIN, Hyd)
Preparation of Uggu

1. 3 cups of Rice + 1 cup of Dal (Moong dal / Channa (putana) / Tur dal/masoor dal)
2. Soak for 1 hour
3. Dry, roast and powder. Store Uggu in airtight containers
4. Freshly prepare before feeding to the infant
   - For every 1 tablespoon of Uggu, use 150 mL of water.
   - When preparing the feed, add uggu powder to boiling water and stir till thickened.
   - Start with once a day and gradually increase the frequency / quantity.

Do's and Don’ts in complementary feeding
